

Description

Dedicated Hosting is exceptionally suitable for optimal accessibility and reliability of one or more large/complex/frequently visited website(s). The server is dedicated. This implies that you don't have to share the server with other customers and that the entire capacity of the hardware/software and bandwidth is dedicated to your website(s). It also means that your website(s) is/are less sensitive to large data traffic during peak hours and disturbing influences of other websites. With Dedicated Hosting you make use of a server delivered by XS4ALL. Your website(s) is/are hosted on a powerful, cutting-edge server that has been configured with the Linux operating system. XS4ALL manages and maintains the server with operating system and hosting applications. You receive a login name and password in order to access the server and remotely update the contents of your website(s). The server is connected to the internet and the XS4ALL backbone through a Fast Ethernet Switch. The result is a very performant and highly stable internet connection.

Specifications

High quality hardware dedicated server <input type="checkbox"/>	Dell PowerEdge 1650 (Pentium III 1,26 Ghz, 512 MB ECC RAM, 36 GByte SCSI (10.000 rpm)harddisk)
Operating system :	Unix-based
Applications :	webserver application (incl. https), CGI-scripts, Perl, MySQL, SSL and PHP

Services

1. Server

- Use of the server, rackspace included, electricity, air-conditioning and alarm on the server room
- The chosen volume of data traffic in GByte (down-/up traffic is added up)
- Standard Account with dial-in access to the internet
- Connecting the server through a 100 Mbit/s port on a Fast Ethernet switch
- Management and maintenance of the hardware, operating system and webhosting applications
- Basic security of the server and hosting applications
- Possibility to upload content through FTP-access
- Fixed IP-address
